The Tree Care Experts

RECOMMENDED TREES FOR NORTH CENTRAL TEXAS

Soil, temperature, and rainfall dictate what tree species will grow successfully in an area. The following trees have proven over time to be good selections for North Central Texas, however, there are potential problems with all tree species.

On most residential lots, it is recommended to plant 2" to 4" caliper trees. Generally, it takes two to three years for a tree to become established and thrive. Larger trees are available; then again, the larger the tree is at planting, the longer it takes to establish itself and the lower the survival rate.

Contact a reputable nursery to purchase, plant, and guarantee your tree.
